

EAE 298 Aeroacoustics
Fall Quarter 2016
Homework #4

John Karasinski

December 5, 2016

You are designing a new aircraft engine and analyzing acoustic propagation generated by a non-uniform flow with angle of attack interacting with rotating fans. You obtained flow fields from CFD for a one-sixth small scale of the engine. The radius for the small scale engine is 13 in and the hub radius is 3 in. CFD provides the velocity gust information as a function of its circumferential modes. The circumferential mode for acoustics can be expressed as $m = nB - kV$ where B is the number of blades, V is the number of vanes, n stands for the harmonic of BPF and k is the integer (1, 2, 3...). You consider only positive k at this time (this is related the rotation direction of gust). The number of blades is 18. The number of vanes is considered to be 1 since there is no physical vanes but there is one revolution difference. The Mach number is 0.525 and the fan RPM is 8326.3042, the speed of sound is 13503.937009 in/s and the density is 1.4988E-5 slug/in³. The dominant noise is generated at the 1st BPF or $n=1$ in which the angular frequency is given as $RPM \times \frac{2\pi}{60} \times B$. We are interested in the propagation through the inlet of the engine so that sound propagates to -z direction assuming the +z direction is in the flow direction.

Problem 1. [20 points]

Determine the first five eigenvalues of acoustics for $m=18, 17, 16, 15$ or ($k=1, 2, 3, 4$) or $(m,n) = (18,0), (18,1), (18,2), (18,3), (18,4), (17,0), (17,1), (17,2), (17,3), (17,4), (16,0), (16,1), (16,2), (16,3), (16,4), (15,0), (15,1), (15,2), (15,3), (15,4)$

n	15	16	17	m 18
0	1.3093	1.3895	1.4696	1.5495
1	1.7032	1.7896	1.8755	1.9612
2	2.0137	2.1036	2.1932	2.2823
3	2.3005	2.3932	2.4855	2.5772
4	2.5753	2.6702	2.7646	2.8585

Problem 2. [20 points]

Plot the five eigenfunctions (radial modes, $n=0, 1, 2, 3, 4$) for $m=18, 17, 16, 15$ or ($k=1, 2, 3, 4$) and verify n describes the number of zero crossings in the radial direction

**Problem 3. [20 points]**

Determine the wavenumbers in the z direction for $(m,n)=(18,0), (18,1), (18,2), (17,0), (17,1), (17,2), (16,0), (16,1), (16,2), (15,0), (15,1), (15,2)$. Indicate whether the mode is cut-on (propagating) or cut-off (exponentially decaying). Consider only the propagation in the $-z$ direction. Exclude the exponentially growing solution and include only the propagating solutions or exponentially decaying solutions.

Problem 4. [30 points]

The pressure distribution file at $z=0$ plane for $m=18$ or 1 BPF is provided. The first column is the dimensional radius [in], the second column the real part of the pressure [psi], and the third column is the imaginary part of the pressure [psi]. Using this boundary condition, compute the sound power level for $(m,n)=(18,0), (18,1), (18,2)$. This noise is considered for blade self noise that is not associated with the gust response since $k=0$. Note that the $z=0$

plane is not the same as the engine inlet. Use the conversion for the unit for the sound power as follows: $PWL\ (dB) = 10 \cdot \log_{10}(W_{mn}) - 10 \cdot \log_{10}(7.3756E-13)$
